

Lifecycle: attributeChangedCallback

Invoked any time a watched attribute is added, removed, or changed.

Function provides name, oldValue, newValue as inputs that you can use to determine how to alter the web component based on this change.

Lifecycle: observedAttributes

A way to identify which attributes you want to watch for changes.

Should return an array containing the names of the attributes you want to observe.

```
class Card extends HTMLElement {  
    static get observedAttributes() {  
        return ['horizontal', 'background', 'src'];  
    }  
}
```
