What does it all mean?

No more name-spacing requirements.

No more specificity battles.*

No more hoping your semantic and accessibility guidance is followed in production.

Duplicate IDs across shadow boundaries? No problem.

Duplicate IDs across shadow boundaries? No problem.

Best practices

Since specificity is less of a concern:

- Assign semantic styles to semantic DOM.

- Leverage IDs (especially if you're already using them for interaction or aria).

- Styles based on state don't need their own classes.

- Get comfortable leveraging !important again.
