Lifecycle: observedAttributes

A way to identify which attributes you want to watch for changes.

Should return an array containing the names of the attributes you want to observe.

```javascript
class Card extends HTMLElement {
    static get observedAttributes() {
        return ['horizontal', 'background', 'src'];
    }
}
```

Lifecycle: disconnectedCallback

Invoked each time the custom element is disconnected from the document's DOM.

Things we can do here:

- Clean up your event listeners and mutation observers

- Kick off an action or fire a custom event to perform tasks related to this elements removal
